Visual Exploration of Big Spatio-Temporal Urban Data: A Study of New York City Cab Trips

Nivan Ferreira, Jorge Poco, Huy T. Vo, Juliana Freire, and Claudio T. Silva
Poly and CUSP, New York University
Big Cities – the world is urbanizing

Cities are the cause of our problems and the source of the solutions

- Africa: 14% in 1950, 40% in 2011, 73% in 2050
- Asia: 18% in 1950, 58% in 2011, 64% in 2050
- Europe: 64% in 1950, 73% in 2011, 82% in 2050
- Latin America and the Caribbean: 41% in 1950, 79% in 2011, 87% in 2050
- Northern America: 62% in 1950, 82% in 2011, 89% in 2050
- Oceania: 62% in 1950, 71% in 2011, 73% in 2050
Properly acquired, integrated, and analyzed, data can

- Take government beyond imperfect understanding
  - Better (and more efficient) operations, better planning, better policy
- Improve governance and citizen engagement
- Enable the private sector to develop new services for citizens, governments, firms
- Enable a revolution in the social sciences
Urban Data Sources

- **Organic data flows**
  - Administrative records (census, permits, …)
  - Transactions (sales, communications, …)
  - Operational (traffic, transit, utilities, health system, …)
  - New and social media (Twitter feeds, blog posts, Facebook, …)

- **Sensors**
  - Personal (location, activity, physiological)
  - Fixed *in situ* sensors
  - Crowd sourcing (mobile phones, …)
  - Choke points (people, vehicles)

- **Opportunities for “novel” sensor technologies**
  - Visible, infrared and spectral imagery
  - RADAR, LIDAR
  - Gravity and magnetic, seismic, acoustic
  - Ionizing radiation, biological, chemical
Taxis as Sensors for NYC

- Taxis are sensors that can provide unprecedented insight into city life: economic activity, human behavior, mobility patterns, …

“What is the average trip time from Midtown to the airports during weekdays?”

“How the taxi fleet activity varies during weekdays?”

“How was the taxi activity in Midtown affected during a presidential visit?”

“How did the movement patterns change during Sandy?”

“Where are the popular night spots?”
Exploring Taxi Trips: Challenges

Taxi data are:

- **Big:** 520 million trips -- ~500k trips/day
  - Can’t use existing tools for interactive exploration
- **Complex:** Multiple variables: spatial and temporal + trip attributes
  - Hard to select data -- too many data slices
- **Dirty:** Taxis in the river…

Domain scientists and decision makers are unable to interactively explore the whole data
Exploring Taxi Trips: Challenges

Taxi data are:

- **Big**: 520 million trips -- ~500k trips/day
  - Can’t use existing tools for interactive exploration
- **Complex**: Multiple variables: *spatial and temporal* + *trip attributes*
  - Hard to select data -- too many data slices
- **Dirty**: Taxis in the river…

[Maps showing taxi trips at different times of day]
TaxiVis: Visually Exploring NYC Taxi Data

- New model that allows users to visually query taxi trips, easily select and compare different spatial-temporal slices
  - Data selection through visual manipulations
  - Use visualization to explore selected data
  - Support for origin-destination queries that enable the study of mobility across the city
  - Use multiple coordinated views to allow comparisons, and brushing to support query refinements
  - Use of adaptive level-of-detail rendering and heat maps to generate clutter-free visualization for large results
  - Scalable system that provides interactive response times for spatio-temporal queries over large data

- Visual query languages
  - GeoPQL [Ferri and Rafanelli 2005]
  - Moving GeoPQL [D’Ulizia et al. 2012]
  - Query-by-trace [Erwig and Schneider 2000]
  - TrajectoryLenses [Krueger et al. 2013]
Desiderata in TaxiVis

• End-to-end solution for interactive visual analytics
  • Couples database back-end with a usable interface front-end
• Support interactive queries for the entire (growing) datasets
  • Out-of-core data access
Data – limits of existing technology

- Raw data:
  - 3 years: 2009, 2011, and 2012
  - 150 GB in 48 CSV files
  - 520M trips total
- After cleanup and transformation:
  - 50GB in binary format
  - 12 fields with 2 temporal spatial attributes

<table>
<thead>
<tr>
<th></th>
<th>SQLite</th>
<th>PostgreSQL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage Space in GB</td>
<td>100</td>
<td>200</td>
</tr>
<tr>
<td>Building Indices in Minutes (One Year of Data)</td>
<td>3,120</td>
<td>780</td>
</tr>
<tr>
<td>1K Items Query in Seconds</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>100K Items Query in Seconds</td>
<td>85</td>
<td>24</td>
</tr>
</tbody>
</table>
Data – limits of existing technology

- Raw data:
  - 3 years: 2009, 2011, and 2012
  - 150 GB in 48 CSV files
  - 520M trips total
- After cleanup and transformation:
  - 50GB in binary format
  - 12 fields with 2 temporal spatial attributes
- Solution:
  - New spatio-temporal index based on out-of-core Kd-tree
    - Can also index other attributes

<table>

</table>
Data Exploration: A Two-Phase Process

- **Data selection**
  - Specify query constraints

- **Visual analysis**
  - Investigate selected data through visualization
  - Discover regions of interest
  - Define new data selections for further exploration

We unify the two phases of the process through visual operations.
Interactive Visual Exploration

- Help users easily select data slices
  - Composition of spatio-temporal constraints
- Provide visualizations of the slices within the spatio-temporal context
- Multiple coordinated views
  - Time series, histogram plots
  - Heat maps
- Comparative visualizations
  - Multiple query results
  - Exploration in time
  - Summary of attributes
Visual Query Model

- Data selection by visual operations
- Each data slice can be assigned a different visual representation
  - Spatial context is maintained in the map view
- Query Expressiveness [Peuquet 1994]
  - when + where $\rightarrow$ what
  - when + what $\rightarrow$ where
  - where + what $\rightarrow$ when
“What is the average trip time from Midtown to the airports during weekdays?”
When + Where → What

“What is the average trip time from Midtown to the airports during weekdays?”
“What is the average trip time from Midtown to the airports during weekdays?”
"What is the average trip time from Midtown to the airports during weekdays?"
Visual Data Selection

\[
\begin{align*}
\text{SELECT} & \quad * \\
\text{FROM} & \quad \text{trips} \\
\text{WHERE} & \quad \text{pickup\_time} \in (5/1/11,5/7/11) \\
& \quad \text{AND} \\
& \quad \text{dropoff\_loc} \in \text{"Times Square"} \\
& \quad \text{AND} \\
& \quad \text{pickup\_loc} \in \text{"Gramercy"}
\end{align*}
\]

Interactively explore data through the map view and plot widgets.
Cross-filtered Views: trip distributions by area
Temporal Comparison: Hurricane Sandy
Analyzing Movement
Comparative Visualization: Night Life in NYC
Conclusion & Limitations

- Easy-to-use system to interactively explore large multivariate spatial-temporal data
  - Couples database and visualization
- Desktop-based application
  - Web-based map
- Need support for multiple data layers
Future and Ongoing Work

- Apply to other urban mobility data, e.g., data from the NYC bike share program
- Support additional data layers: weather, gas prices, news, tweets, etc.
- Utilize parallel processing
